

Software Requirements Specification (SRS)

Hotel Management System

1. Introduction

1.1 Abstract

The Hotel Management System is a console-based application developed using Python. The system helps hotel staff manage hotel operations digitally, including room booking, customer check-in and check-out, room availability, billing, and customer records. It is designed to simplify hotel operations and improve efficiency through an easy-to-use interface.

1.2 Purpose

The purpose of this project is to develop a Hotel Management System that automates hotel management tasks. The system allows hotel staff to manage customer details, room bookings, payments, and room status efficiently.

1.3 Scope

This system is designed for small and medium-sized hotels. It helps staff maintain customer records, room details, booking information, and billing processes in an organized manner.

2. System Description

Overview

The Hotel Management System is a console-based application that replaces manual hotel management methods. It allows hotel staff to perform hotel operations quickly and accurately.

2.1 Main Features

- Customer registration and management
- Room booking and cancellation
- Customer check-in and check-out
- Room availability tracking
- Billing and payment management
- View customer and room details
- Simple menu-driven console interface

3. Functional Requirements

3.1 Customer Management

- The system should allow staff to add customer details.
- The system should store customer information safely.
- The system should allow staff to view customer records.

3.2 Room Operations

- The system should allow room booking and cancellation.
- The system should display room availability.
- The system should update room status automatically.

3.3 Billing and Payment

- The system should generate bills for customers.
- The system should calculate room charges automatically.
- The system should display payment details clearly.

4. Non-Functional Requirements

4.1 Performance

- The system should respond quickly to user actions.
- The application should handle multiple records efficiently.

4.2 Security

- Only authorized users should access the system.
- Customer records should be stored securely.

4.3 Usability

- The system should be easy to use.
- The console menu should be simple and user-friendly.

4.4 Reliability

- Customer and booking data should be saved properly.
- The system should reduce manual errors.

5. Technology Stack

5.1 Frontend

- Python Console Interface

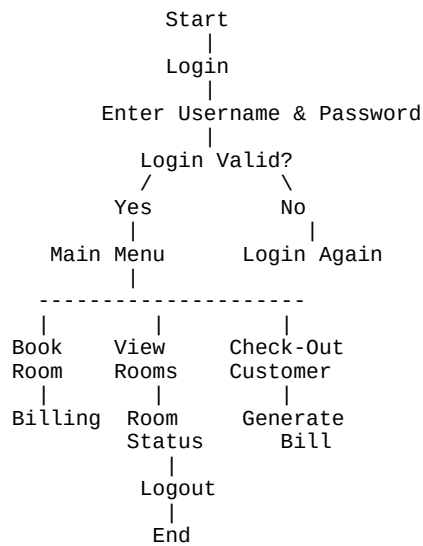

5.2 Backend

- Python

5.3 Database

- SQLite
- File Handling

6. User Diagram

7. Future Scope

- Online room booking support
- Integration with payment gateways
- Customer feedback and rating system
- Cloud database support
- Mobile application integration

8. Conclusion

The Hotel Management System helps hotels manage daily operations efficiently through a simple console-based application. It simplifies booking, billing, room management, and customer record handling. The system reduces manual work, improves accuracy, and provides an organized method for managing hotel operations.
